

Coding Style Guide

Make it look nice.

Add comments inside functions.

Spacing:

- No tabs — use 4 spaces to indent.
- Add spaces between operators. Instead of `x+y` write `x + y`.
- Add lines of whitespace between blocks of code.
- Spaces before braces.
- Call functions like this: `func(arg1, arg2, ...)`
 - For multiline functions, they should look like this:
 - `func(`
 - Lay args out logically
 - `);` <- on its own line or after last argument; make it look nice
- For parameterized keywords: `for (args)`
 - Space after keyword and before parenthesis.

For keywords, braces on the same line

```
for () {  
if () {
```

For functions, braces on separate line

```
TypeName funcName(args)  
{  
    /* code */  
}
```

(MORE ON NEXT PAGE)

```
functionName  
ClassName  
ConstName  
variableName  
EnumName  
filename.h  
mPrivateMember
```

Use documentation comments (`/**` or `///`) in headers to document functions and class members.
